

## NMC27C32B 32,768-Bit (4096 x 8) CMOS EPROM

### General Description

The NMC27C32B is a 32k UV erasable and electrically re-programmable CMOS EPROM, ideally suited for applications where fast turnaround, pattern experimentation and low power consumption are important requirements.

The NMC27C32B is designed to operate with a single +5V power supply with  $\pm 10\%$  tolerance.

The NMC27C32B is packaged in a 24-pin dual-in-line package with a quartz window. The quartz window allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written electrically into the device by following the programming procedure.

This EPROM is fabricated with National's proprietary, time proven CMOS double-poly silicon gate technology which combines high performance and high density with low power consumption and excellent reliability.

### Features

- Low CMOS power consumption
  - Active Power: 55 mW Max
  - Standby Power: 0.55 mW Max
- Extended temperature range,  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- Fast and reliable programming
- TTL, CMOS compatible inputs/outputs
- TRI-STATE<sup>®</sup> output
- Manufacturer's identification code for automatic programming
- High current CMOS level output drivers
- Compatible with NMOS 2732

Input Rise and Fall Times	$\leq 5\text{ ns}$		
Input Pulse Levels	0.45V to 2.4V		

## AC Waveforms (Note 7)

TL/D/8827-3

**Note 1:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 2:** This parameter is only sampled and is not 100% tested.

**Note 3:**  $\overline{OE}$  may be delayed up to  $t_{ACC} - t_{OE}$  after the falling edge of  $\overline{CE}$  without impacting  $t_{ACC}$ .

**Note 4:** The  $t_{DF}$  and  $t_{CF}$  compare level is determined as follows:

- High to TRI-STATE, the measured  $V_{OH1}$  (DC)  $- 0.10\text{V}$ ;
- Low to TRI-STATE, the measured  $V_{OL1}$  (DC)  $+ 0.10\text{V}$ .

**Note 5:** TRI-STATE may be attained using  $\overline{OE}$  or  $\overline{CE}$ .

**Note 6:** The power switching characteristics of EPROMs require careful device decoupling. It is recommended that at least a  $0.1\text{ }\mu\text{F}$  ceramic capacitor be used on every device between  $V_{CC}$  and GND.

**Note 7:** The outputs must be restricted to  $V_{CC} + 1.0\text{V}$  to avoid latch-up and device damage.

**Note 8:** 1 TTL Gate:  $I_{OL} = 1.6\text{ mA}$ ,  $I_{OH} = -400\text{ }\mu\text{A}$ .  
 $C_L$ :  $100\text{ pF}$  includes fixture capacitance.

**Note 9:** Inputs and outputs can undershoot to  $-2.0\text{V}$  for 20 ns Max, except for  $\overline{OE}/V_{PP}$  which cannot exceed  $-0.2\text{V}$ .

**Note 10:** Typical values are for  $T_A = 25^\circ\text{C}$  and nominal supply voltages.

## Programming Characteristics (Notes 1, 2, 3 & 4)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$t_{AS}$	Address Setup Time		1			$\mu\text{s}$

$t_{OUT}$	Output Timing Reference Voltage		0.8		2.0	V

## Programming Waveforms

TL/D/8827-4

**Note 1:** National's standard product warranty applies only to devices programmed to specifications described herein.

**Note 2:**  $V_{CC}$  must be applied simultaneously or before  $V_{PP}$  and removed simultaneously or after  $V_{PP}$ . The EPROM must not be inserted into or removed from a board with voltage applied to  $V_{PP}$  or  $V_{CC}$ .

**Note 3:** The maximum absolute allowable voltage which may be applied to the  $V_{PP}$  pin during programming is 14V. Care must be taken when switching the  $V_{PP}$  supply to prevent any overshoot from exceeding this 14V maximum specification. At least a 0.1  $\mu\text{F}$  capacitor is required across  $V_{CC}$  to GND to suppress spurious voltage transients which may damage the device.

**Note 4:** Programming and program verify are tested with the fast Program Algorithm, at typical power supply voltages and timings.

# Fast Programming Algorithm Flow Chart (Note 4)

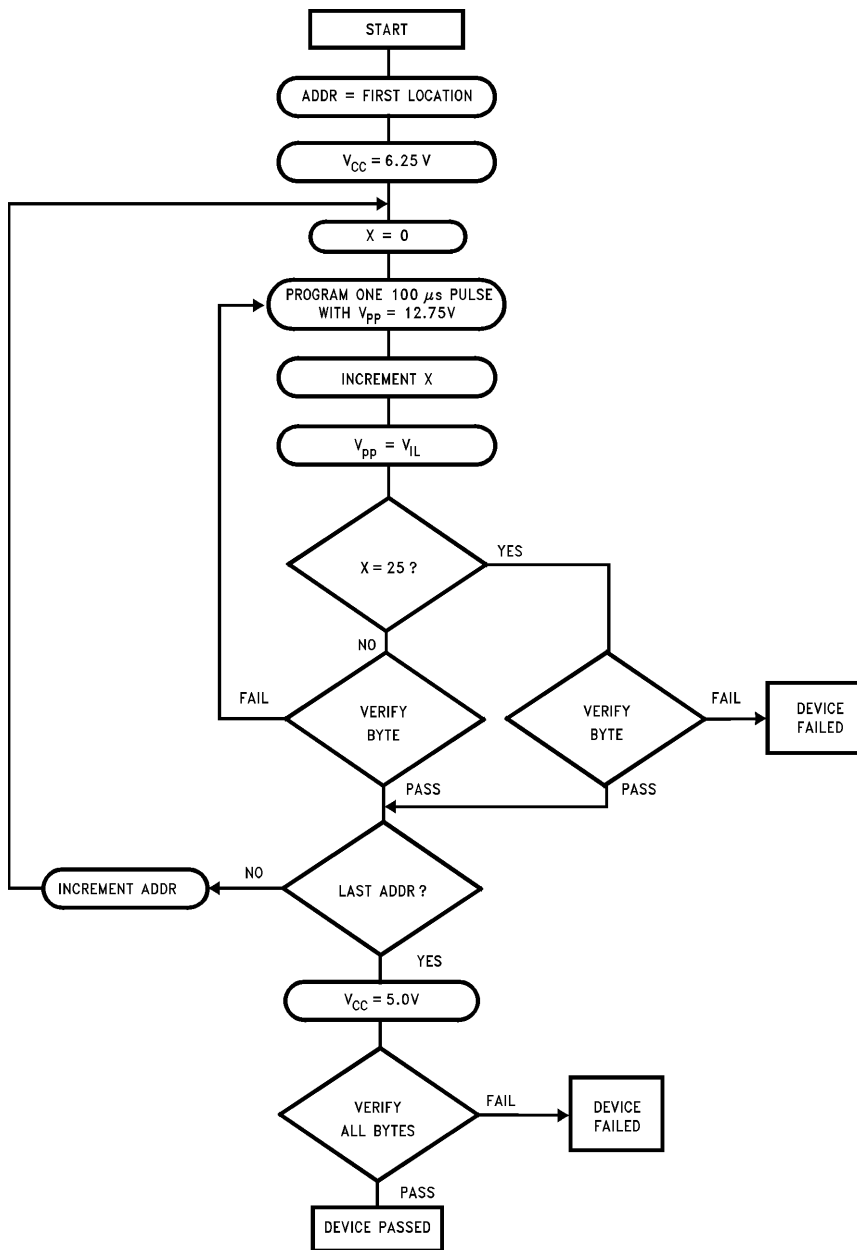

FIGURE 1

## Functional Description

### DEVICE OPERATION

The six modes of operation of the NMC27C32B are listed in Table I. A single 5V power supply is required in the read mode. All inputs are TTL levels except for  $\overline{OE}/V_{PP}$  during programming. In the program mode the  $\overline{OE}/V_{PP}$  input is pulsed from a TTL low level to 12.75V.

#### Read Mode

The NMC27C32B has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable ( $\overline{CE}$ ) is the power control and should be used for device selection. Output Enable ( $\overline{OE}$ ) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that addresses are stable, address access time ( $t_{ACC}$ ) is equal to the delay from  $\overline{CE}$  to output ( $t_{CE}$ ). Data is available at the outputs  $t_{OE}$  after the falling edge of  $\overline{OE}$ , assuming that  $\overline{CE}$  has been low and addresses have been stable for at least  $t_{ACC}-t_{OE}$ .

The sense amps are clocked for fast access time.  $V_{CC}$  should therefore be maintained at operating voltage during read and verify. If  $V_{CC}$  temporarily drops below the spec. voltage (but not to ground) an address transition must be performed after the drop to ensure proper output data.

#### Standby Mode

The NMC27C32B has a standby mode which reduces the active power dissipation by 99%, from 55 mW to 0.55 mW. The NMC27C32B is placed in the standby mode by applying a CMOS high signal to the  $\overline{CE}$  input. When in standby mode, the outputs are in a high impedance state, independent of the  $\overline{OE}$  input.

#### Output OR-Tying

Because EPROMs are usually used in larger memory arrays, National has provided a 2-line control function that accommodates this use of multiple memory connection. The 2-line control function allows for:

- The lowest possible memory power dissipation, and
- complete assurance that output bus contention will not occur.

To most efficiently use these two control lines, it is recommended that  $\overline{CE}$  (pin 18) be decoded and used as the primary device selecting function, while  $\overline{OE}$  (pin 20) be made a

common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low power standby modes and that the output pins are active only when data is desired from a particular memory device.

#### Programming

CAUTION: Exceeding 14V on pin 20  $\overline{OE}/V_{PP}$  will damage the NMC27C32B.

Initially, and after each erasure, all bits of the NMC27C32B are in the "1" state. Data is introduced by selectively programming "0s" into the desired bit locations. Although only "0s" will be programmed, both "1s" and "0s" can be presented in the data word. The only way to change a "0" to a "1" is by ultraviolet light erasure.

The NMC27C32B is in the programming mode when  $\overline{OE}/V_{PP}$  is at 12.75V. It is required that at least a 0.1  $\mu$ F capacitor be placed across  $V_{CC}$  and ground to suppress spurious voltage transients which may damage the device. The data to be programmed is applied 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL.

When the address and data are stable, an active low, TTL program pulse is applied to the  $\overline{CE}$  input. A program pulse must be applied at each address location to be programmed. The NMC27C32B is programmed with the Fast Programming Algorithm shown in *Figure 1*. Each Address is programmed with a series of 100  $\mu$ s pulses until it verifies good, up to a maximum of 25 pulses. Most memory cells will Program with a single 100  $\mu$ s pulse.

**Note:** Some programmer manufactures due to equipment limitation may offer interactive program Algorithm (Shown in *Figure 2*).

The NMC27C32B must not be programmed with a DC signal applied to the  $\overline{CE}$  input.

Programming multiple NMC27C32Bs in parallel with the same data can be easily accomplished due to the simplicity of the programming requirements. Like inputs of the paralleled NMC27C32B may be connected together when they are programmed with the same data. A low level TTL pulse applied to the  $\overline{CE}$  input programs the paralleled NMC27C32B.

TABLE I. Mode Selection

Mode	Pins		$V_{CC}$ (24)	Outputs (9-11, 13-17)
	$\overline{CE}$ (18)	$\overline{OE}/V_{PP}$ (20)		
Read	$V_{IL}$	$V_{IL}$	5V	$D_{OUT}$
Standby	$V_{IH}$	Don't Care	5V	Hi-Z
Program	$V_{IL}$	12.75V	6.25V	$D_{IN}$
Program Verify	$V_{IL}$	$V_{IL}$	6.25V	$D_{OUT}$
Program Inhibit	$V_{IH}$	12.75V	6.25V	Hi-Z
Output Disable	Don't Care	$V_{IH}$	5V	Hi-Z

## Functional Description (Continued)

### Program Inhibit

Programming multiple NMC27C32B in parallel with different data is also easily accomplished. Except for  $\overline{CE}$  all like inputs (including  $\overline{OE}$ ) of the parallel NMC27C32B may be common. A TTL low level program pulse applied to an NMC27C32B's  $\overline{CE}$  input with  $\overline{OE}/V_{PP}$  at 12.75V will program that NMC27C32B. A TTL high level  $\overline{CE}$  input inhibits the other NMC27C32B from being programmed.

### Program Verify

A verify should be performed on the programmed bit to determine whether they were correctly programmed. The verify is accomplished with  $\overline{OE}/V_{PP}$  and  $\overline{CE}$  at  $V_{IL}$ . Data should be verified  $t_{DV}$  after the falling edge of  $\overline{CE}$ .

### MANUFACTURER'S IDENTIFICATION CODE

The NMC27C32B has a manufacturer's identification code to aid in programming. The code, shown in Table II, is two bytes wide and is stored in a ROM configuration on the chip. It identifies the manufacturer and the device type. The code for the NMC27C32B is, "8F01", where "8F" designates that it is made by National Semiconductor, and "01" designates a 32k part.

The code is accessed by applying  $12.0V \pm 0.5V$  to address pin A9. Addresses A1–A8, A10–A11,  $\overline{CE}$ , and  $\overline{OE}$  are held at  $V_{IL}$ . Address A0 is held at  $V_{IL}$  for the manufacturer's code, and at  $V_{IH}$  for the device code. The code is read out on the 8 data pins. Proper code access is only guaranteed at  $25^{\circ}C \pm 5^{\circ}C$ .

The primary purpose of the manufacturer's identification code is automatic programming control. When the device is inserted in an EPROM programmer socket, the programmer reads the code and then automatically calls up the specific programming algorithm for the part. This automatic programming control is only possible with programmers which have the capability of reading the code.

### ERASURE CHARACTERISTICS

The erasure characteristics of the NMC27C32B are such that erasure begins to occur when exposed to light with wavelengths shorter than approximately 4000 Angstroms ( $\text{\AA}$ ). It should be noted that sunlight and certain types of fluorescent lamps have wavelengths in the 3000 $\text{\AA}$ –4000 $\text{\AA}$  range. After programming, opaque labels should be placed over the NMC27C32B's window to prevent unintentional

erasure. Covering the window will also prevent temporary functional failure due to the generation of photo currents.

The recommended erasure procedure for the NMC27C32B is exposure to short wave ultraviolet light which has a wavelength of 2537 $\text{\AA}$ . The integrated dose (i.e., UV intensity  $\times$  exposure time) for erasure should be a minimum of 15 W-sec/cm<sup>2</sup>.

The NMC27C32B should be placed within 1 inch of the lamp tubes during erasure. Some lamps have a filter on their tubes which should be removed before erasure. Table III shows the minimum NMC27C32B erasure time for various light intensities.

An erasure system should be calibrated periodically. The distance from lamp to unit should be maintained at one inch. The erasure time increases as the square of the distance. (If distance is doubled the erasure time increases by a factor of 4.) Lamps lose intensity as they age. When a lamp is changed, the distance has changed or the lamp has aged, the system should be checked to make certain full erasure is occurring. Incomplete erasure will cause symptoms that can be misleading. Programmers, components, and even system designs have been erroneously suspected when incomplete erasure was the problem.

### SYSTEM CONSIDERATION

The power switching characteristics of EPROMs require careful decoupling of the devices. The supply current,  $I_{CC}$ , has three segments that are of interest to the system designer—the standby current level, the active current level, and the transient current peaks that are produced by voltage transitions on input pins. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. The associated  $V_{CC}$  transient voltage peaks can be suppressed by properly selected decoupling capacitors. It is recommended that at least a 0.1  $\mu$ F ceramic capacitor be used on every device between  $V_{CC}$  and GND. This should be a high frequency capacitor of low inherent inductance. In addition, at least a 4.7  $\mu$ F bulk electrolytic capacitor should be used between  $V_{CC}$  and GND for each eight devices. The bulk capacitor should be located near where the power supply is connected to the array. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of the PC board traces.

**LIFE SUPPORT POLICY**

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
